Selected Ongoing Projects

Since Jun 2025 | **Manifold Fitting for Biological Sequence Embeddings**
- Extends our manifold fitting framework to high-dimensional embeddings produced by Transformer-based DNA/RNA language models.
- Identifies low-dimensional structures that coherently organise sequences sharing biological functions, providing geometric insight into the "sequence language space."
- Incorporates the fitted manifolds into classification, clustering, and other downstream tasks, enhancing accuracy and interpretability over raw embeddings.

Since Jan 2024 | **Low-dimension Structure Analysis Based on UK Biobank**
- Applies manifold-fitting methods to large-scale biomedical data, with a focus on the UK Biobank.
- Aims to uncover low-dimensional structures within high-dimensional population health data.
- Leverages these structures to improve population stratification and refine medical risk assessments.
